

#### What is our GOAL for this MODULE?

The goal for this module is to explore the concepts of class.

### What did we ACHIEVE in the class TODAY?

- Created a Box class which creates a template for new objects to be made using the sphysics engine.
- Created two box objects using the Box class template.
- Tuned the physics engine for properties like density, friction etc. for these objects so that they topple over each other
- Displayed the rectangle so that it can draw with its orientation.

## Which CONCEPTS/ CODING BLOCKS did we cover today?

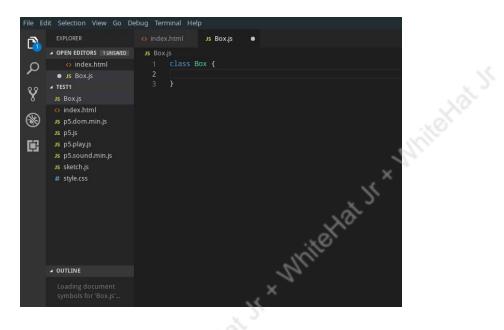

- Creating class object
- Tuning the physics engine to give objects properties

## How did we DO the activities?

We need many boxes as obstacles in which our enemy Pigs will be hiding.

- 1. Create a blueprint for our box.
  - A blueprint for an object is called a Class.
- 2. Create a new file in the same folder called Box.js.

3. Put the x, y, width and height values here as 200, 100, 50, 50. \*\*Note: Put all these inside constructor () {}

4. Add an option here, which will finetune the physics engine for the object.

```
class Box {
    var options = {
        restitution: 1:
        this.body = Bodies.rectangle(200, 100, 50,50, options):
        world.add(world, this.body):
    }
}
```

Add this object to the world.

```
class Box {
   var options = {
      restitution: 1:
   }
   this.body = Bodies.rectangle(200, 100, 50,50, options):
   world.add(world. this.body):
}
```

• Display this object using a display() function.

5. In the sketch is file, remove all the statements associated with creating the bodies.

```
const Engine = Matter.Engine;
const World= Matter.World;
const Bodies = Matter.Bodies;

var engine, world;

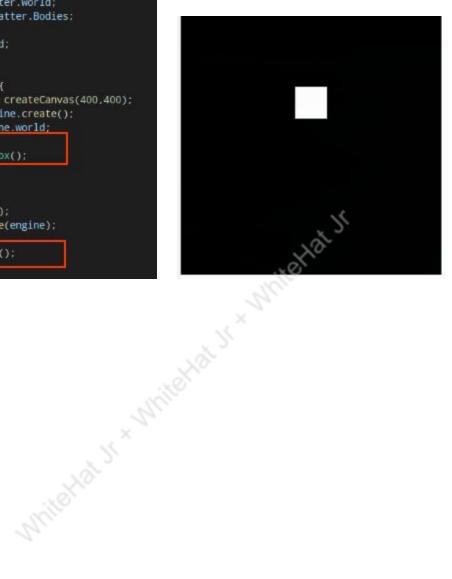

function setup(){
    var canvas - createCanvas(400,400);
    engine - Engine.create();
    world - engine.world;

function draw(){
    background(0);
    Engine.update(engine);
}
```

6. Create a new object and display it with just two statements.

```
const Engine = Matter.Engine;
    const World= Matter.World;
    const Bodies = Matter.Bodies;
         engine, world;
    var box1;
    function setup(){
        var canvas - createCanvas(400,400);
        engine - Engine.create();
        world = engine.world;
13
14
        box1 = new Box();
    function draw(){
        background(0);
        Engine.update(engine);
        box1.display();
```

- 7. Write code in the Box class to show how a constructor of a class can take arguments:
  - Tell the computer where to draw the rectangle and of what dimensions, by passing the x,y, width and height to the constructor.

8. Create the second box object using the Box class.

```
const Engine = Matter.Engine;
const World= Matter.World;
const Bodies = Matter Bodies;
var engine, world;
var box1:
function setup(){
    var canvas - createCanvas(400,400);
    engine - Engine create():
    world - engine world;
    box1 = new Box(200, 100, 50, 50);
    box2 = new Box(100,50,50,100);
function draw(){
    background(0);
    Engine.update(engine);
    box1.display();
    box2.display():
```

9. Create a Ground class blueprint and then create a ground object using it.

```
class Ground {
    constructor(x,y,width,height) {
        var options = {
            isStatic: true
        }
        this.body = Bodies.rectangle(x,y,width,height.options);
        this.width = width;
        this.height = height;
        World.add(world, this.body);
    }
    display(){
        var pos =this.body.position;
        rectMode(CENTER);
        fill(255);
        rect(pos.x, pos.y, this.width, this.height);
    }
};
```

```
const Engine = Matter Engine
const World= Matter.World;
const Bodies = Matter.Bodies%
var engine, world;
var box1:
function setup(){
   var canvas - createCanvas(400,400);
   engine - Engine.create():
   world - engine.world;
   box1 = new Box(200,300,50,50);
   box2 = new Box(200, 100, 50, 100);
   ground = new Ground(200,390,400,20)
function draw(){
   background(0);
    Engine.update(engine);
   box1.display():
   box2.display():
   ground.display();
```

- 10. Stack the two box objects on top of each other.
  - Allow the box2 to fall on the top of box 1.

```
const Engine = Matter.Engine;
    const World= Matter.World;
    const Bodies = Matter Bodies:
    var engine, world;
    var box1:
    function setup(){
        var canvas - createCanvas(400,400);
        engine - Engine.create():
        world - engine.world;
        box1 = new Box(200.300.50.50):
      box2 = new Box(200,100,50,100);
14
        ground = new Ground(200,390,400,20)
    function draw(){
        background(0);
        Engine.update(engine);
        box1.display():
        box2.display():
        ground.display();
```

• Shift box 2 slightly to the right.

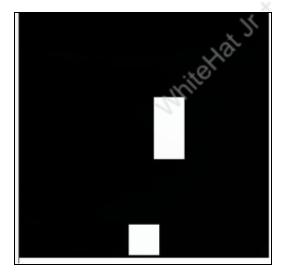

```
const Engine = Matter.Engine;
const World= Matter.World;
const Bodies = Matter Bodies;
var engine, world;
var box1:
function setup(){
   var canvas - createCanvas(400,400);
   engine - Engine.create();
   world - engine.world;
   box1 = new Box(200,300,50,50);
   box2 = new Box(240,100,50,100);
   ground = new Ground(200,390,400,20)
function draw(){
   background(0);
    Engine.update(engine);
   box1.display():
   box2.display():
    ground.display():
```

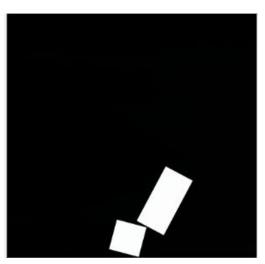

- 11. Store the new translation and rotation setting and then revert back to the old setting when the object is drawn. This is done using push() and pop().
  - push() -> captures the new setting
  - pop() -> reverts back to the old setting
  - translate() -> to change the 0 of the axis to a given x and y position.

```
constructor(x, y, width, height) {
        var options = {
            'restitution':0.8
        this.body = Bodies.rectangle(x. y. width, height, options);
        this.width - width:
        this.height - height:
                                       World.add(world, this.body);
      display(){
       var pos =this.body.position;
       var angle = this.body.angle;
       push();
        translate(pos.x, pos.y);
17
       rotate(angle);
        rectMode(CENTER);
        fill(255):
        rect(0, 0, this.width, this.height);
```

12. You can play around with more properties of objects like restitution, density, friction etc.

# PRO-C23

#### What's next?

Using what we have learnt in this class, we will create the stack of obstacles for the pig in the Angry Birds game.

## Extend your knowledge:

• Go through the following link to know more about the class: https://www.w3schools.com/js/js\_object\_classes.asp
